

HERMES AI AGENT

Complete A-to-Z Setup Guide

Telegram Bot · Local Testing · VPS Production

Windows | WSL | Mac/Linux | Hostinger KVM VPS

Overview — Yeh Guide Kya Cover Karta Hai

Is guide mein step-by-step Hermes AI Agent ka complete setup bataya gaya hai — beginner se lekar production-ready deployment tak. Har section mein commands, explanations, aur common errors bhi hain.

Section	Description
Part 1	Hermes Agent kya hai — introduction aur architecture
Part 2	Pre-requisites — tools jo pehle chahiye
Part 3	Method 1 — Windows (PowerShell) simple setup
Part 4	Method 2 — Windows WSL (best local env)
Part 5	Method 3 — Mac / Linux native setup
Part 6	Method 4 — VPS Production (Hostinger KVM)
Part 7	Telegram Bot — puri detail
Part 8	Keep Alive — tmux, nohup, systemd
Part 9	Security & Logs
Part 10	Common Errors aur Fixes

Part 1 — Hermes Agent Kya Hai?

1.1 System Architecture

Hermes Agent ek AI-powered conversational gateway hai jo Telegram bot se messages receive karta hai, ek AI model ko forward karta hai, aur response wapas Telegram pe bhejta hai.

```
Telegram User --> Telegram Bot --> Hermes Gateway --> AI Model --> Response
```

1.2 Hermes Agent Kya Karta Hai?

- Telegram se aane wale messages receive karta hai
- Message ko Hermes / connected AI model ko bhejta hai
- AI ka response Telegram user ko wapas deta hai
- Multiple users simultaneously handle kar sakta hai
- VPS pe continuously run karta hai — 24/7

IMPORTANT: Hermes Agent ek open-source project hai by NousResearch. Yeh locally aur VPS dono pe chal sakta hai.

Part 2 — Pre-Requisites (Pehle Yeh Install Karo)

2.1 Required Tools

Tool	Purpose aur Download
Python 3.8+	Hermes Agent run karne ke liye — python.org se download karo
pip	Python packages install karne ke liye — Python ke saath aata hai
Git	Source code clone karne ke liye (optional) — git-scm.com
curl	Linux/Mac/WSL pe install script download karne ke liye
Telegram Account	Bot banane ke liye — telegram.org ya app se
VPS (Optional)	Production deployment ke liye — Hostinger KVM2 recommended

2.2 Python Install Karo (Windows)

1. python.org/downloads pe jao
2. Latest Python 3.x download karo
3. Install karte waqt 'Add Python to PATH' checkbox zaroor tick karo
4. Installation ke baad PowerShell open karo aur check karo:

```
python --version
pip --version
```

TIP: Agar 'python' command kaam na kare toh 'python3' try karo. Windows Store Python alag hoti hai.

Part 3 — Method 1: Windows (PowerShell) Simple Mode

Yeh sabse simple method hai. Beginners ke liye best hai. Quick testing aur local development ke liye use karo.

USE CASE: Quick setup, beginner-friendly, local testing. Production ke liye VPS method use karo.

STEP 1

PowerShell as Administrator kholo

Start menu mein 'PowerShell' search karo, right-click karo, 'Run as Administrator' select karo.

STEP 2

Python version check karo

```
python --version  
pip --version
```

STEP 3

Hermes Agent install karo

```
pip install hermes-agent
```

Agar error aaye:

```
pip install hermes-agent --upgrade --user
```

STEP 4

Telegram Bot setup (BotFather se)

Telegram pe @BotFather open karo:

5. /start bhejo
6. /newbot bhejo
7. Bot ka naam do (e.g. MyHermesBot)
8. Username do ending with 'bot' (e.g. myhermesbot_bot)
9. Token copy karo — yeh kuch aisa dikhega:

```
1234567890:ABCdefGHIjklMNOpqrSTUvwxyz
```

IMPORTANT: Token kisi ke saath share mat karo. Yeh tumhara bot password hai.

STEP 5

Hermes Gateway Setup

```
hermes setup gateway
```

10. Platform select karo: Telegram
11. Bot token paste karo
12. Enter press karo — setup complete

STEP
6

Gateway Run Karo

```
hermes gateway
```

Ab Telegram pe apne bot ko 'hello' bhejo — reply aana chahiye!

Part 4 — Method 2: Windows WSL (Best Local Env) ★

WSL (Windows Subsystem for Linux) Windows pe Linux environment provide karta hai. Yeh production server jaisa experience deta hai — debugging aur development ke liye best option hai.

WHY WSL? VPS pe bhi Linux hota hai. WSL pe jo commands kaam karti hain, woh VPS pe bhi exactly same kaam karti hain. Iska matlab hai: local pe test karo, confidently VPS pe deploy karo.

4.1 WSL Install Karo

STEP 1

WSL Enable Karo

PowerShell as Administrator mein:

```
wsl --install
```

Yeh command Ubuntu automatically install karega.

PC restart karna hoga WSL install hone ke baad.

STEP 2

Ubuntu Setup Karo

Restart ke baad Ubuntu terminal automatically khulega.

13. Username set karo (koi bhi simple naam)
14. Password set karo (typing karte waqt visible nahi hogi)
15. Done! Ab tum Linux environment mein ho.

STEP 3

System Update Karo

```
sudo apt update && sudo apt upgrade -y
```

Yeh command sabse pehle run karo — system ko latest state mein le aata hai.

STEP 4

Hermes Install Karo

```
curl -fsSL https://raw.githubusercontent.com/NousResearch/hermes-agent/main/scripts/install.sh | bash
```

Ya manually:

```
pip3 install hermes-agent
```

STEP 5

Setup aur Run

```
hermes setup gateway  
hermes gateway
```

Part 5 — Method 3: Mac / Linux (Native)

Mac aur Linux pe commands WSL se almost same hain. Alag steps nahi hain — same install script kaam karti hai.

STEP 1

Terminal kholo

Mac: Spotlight (Cmd+Space) mein 'Terminal' likho. Linux: Ctrl+Alt+T

STEP 2

Hermes Install Karo

```
curl -fsSL  
https://raw.githubusercontent.com/NousResearch/hermes-  
agent/main/scripts/install.sh | bash
```

Ya pip se:

```
pip3 install hermes-agent
```

STEP 3

Setup aur Run

```
hermes setup gateway  
hermes gateway
```

Mac users: Agar 'curl' ya 'pip3' nahi mila toh Homebrew install karo: `/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"`

Part 6 — Method 4: VPS Production (Hostinger KVM2) ★★

Yeh PRODUCTION method hai. VPS pe Hermes 24/7 chalta rahega — tumhara PC band ho ya on, bot hamesha reply karega. Hostinger KVM2 plan recommended hai.

RECOMMENDED SPECS: Hostinger KVM2 — 2 vCPU, 8GB RAM, Ubuntu 22.04 LTS. Monthly cost ~\$7-10.

6.1 VPS Kharido aur SSH Setup Karo

STEP 1

VPS SSH Se Connect Karo

Hostinger panel se apna VPS IP milega. Phir:

```
ssh root@YOUR_VPS_IP
```

Pehli baar connect karte waqt 'yes' likho aur Enter press karo.

TIP: IP address apne Hostinger account ke VPS Management section mein milega.

STEP 2

System Update Karo

```
apt update && apt upgrade -y
```

Yeh 2-3 minute le sakta hai. Pura hone do.

STEP 3

Required Tools Install Karo

```
apt install python3 python3-pip git curl tmux -y
```

tmux bhi install kar rahe hain — keep-alive ke liye zarurat paregi.

STEP 4

Hermes Install Karo

Option A — pip se:

```
pip3 install hermes-agent
```

Option B — install script se:

```
curl -fsSL  
https://raw.githubusercontent.com/NousResearch/hermes-  
agent/main/scripts/install.sh | bash
```

STEP 5

Telegram Bot Setup Karo

```
hermes setup gateway
```

BotFather se liya hua token yahan paste karo.

STEP
6

Gateway Test Run Karo

```
hermes gateway
```

Telegram pe 'hello' bhejo. Agar reply aaya — sab kuch kaam kar raha hai!
Ctrl+C se band karo — ab permanent run ke liye agla section dekho.

Part 7 — Telegram Bot Complete Guide

7.1 Bot Banana — Step by Step

Telegram bot banana bilkul free hai aur 2 minute lagta hai.

16. Telegram kholo — web.telegram.org ya app
17. Search bar mein @BotFather likho aur first result pe click karo
18. START button dabao ya /start bhejo
19. /newbot bhejo
20. Bot ka display name do (koi bhi, e.g. 'My AI Assistant')
21. Bot ka username do — yeh unique hona chahiye, 'bot' se end hona chahiye
22. Token copy karo — yeh format mein hoga:

```
123456789:ABCdefghijklmnopqrstuvwxyz12345678
```

7.2 Bot Token Kahan Use Karo

hermes setup gateway run karte waqt yeh token paste karna hoga. Config file yahan save hogi:

```
~/.hermes/config.yml
```

7.3 Bot Privacy aur Restrictions

Security ke liye: Bot ka Privacy Mode ON karo (BotFather mein) aur sirf apne users ko allow karo.

BotFather mein /mybots > apna bot > Bot Settings > Group Privacy: ON karo
Sirf specific users allow karne ke liye hermes config mein allowlist add kar sakte ho.

Part 8 — Keep Alive: Bot 24/7 Kaise Chalao

VPS pe sirf 'hermes gateway' run karne se kaam nahi karega — jaise hi SSH session close hogi, bot band ho jayega. Inn teeno methods se bot permanently chalta rahega:

8.1 Option A — Background Process (nohup)

LEVEL: Beginner. Quick aur simple. Reboot pe restart nahi hoga.

```
nohup hermes gateway &
```

'&' command ko background mein run karta hai. 'nohup' SSH close hone ke baad bhi chalata rakhta hai.

Process ID dekhne ke liye:

```
ps aux | grep hermes
```

Band karne ke liye:

```
kill -9 PROCESS_ID
```

8.2 Option B — tmux (Recommended for Testing) ★

LEVEL: Intermediate. Session resume kar sakte ho. Reboot pe restart nahi hoga.

tmux ek terminal multiplexer hai. Iska matlab hai: ek 'screen' banao, program chalaao, aur SSH se bahir niklo — program chalta rahega.

23. Naya tmux session banao:

```
tmux new -s hermes
```

24. Hermes run karo:

```
hermes gateway
```

25. Session se bahir niklo (bot chalata rahega):

```
Ctrl + B    phir    D
```

26. Session mein wapas jao:

```
tmux attach -t hermes
```

27. Sab sessions dekhne ke liye:

```
tmux ls
```

8.3 Option C — Systemd Service (Pro Level) ★★

LEVEL: Advanced. BEST OPTION. Reboot ke baad auto-restart, crash pe auto-restart, logs automatic.

**STEP
1**

Service File Banao

```
nano /etc/systemd/system/hermes.service
```

Yeh content paste karo:

```
[Unit] Description=Hermes AI Agent Gateway After=network.target [Service]
ExecStart=/usr/local/bin/hermes gateway Restart=always RestartSec=10 User=root
StandardOutput=journal StandardError=journal [Install] WantedBy=multi-
user.target
```

STEP 2

Service Enable aur Start Karo

```
systemctl daemon-reload
systemctl enable hermes
systemctl start hermes
```

STEP 3

Status Check Karo

```
systemctl status hermes
```

'active (running)' dikhna chahiye — green color mein.

Useful systemd commands:

Command	Kaam kya karta hai
systemctl start hermes	Service start karo
systemctl stop hermes	Service band karo
systemctl restart hermes	Service restart karo
systemctl status hermes	Current status dekho
systemctl disable hermes	Auto-start disable karo
journalctl -u hermes -f	Live logs dekho

Part 9 — Security aur Logs

9.1 Logs Dekhna

Hermes ke logs yahan hote hain:

```
tail -f ~/.hermes/logs/gateway.log
```

Systemd logs ke liye:

```
journalctl -u hermes -f
```

Last 100 lines dekho:

```
journalctl -u hermes -n 100
```

9.2 VPS Basic Security

|IMPORTANT: Production VPS pe yeh security steps zaroor karo.

SSH ke liye strong password ya key use karo:

```
ssh-keygen -t ed25519 -C 'your_email'  
ssh-copy-id root@YOUR_VPS_IP
```

Firewall setup (UFW):

```
apt install ufw -y  
ufw allow ssh  
ufw allow 443  
ufw enable
```

Automatic security updates:

```
apt install unattended-upgrades -y  
dpkg-reconfigure -plow unattended-upgrades
```

9.3 Bot User Restriction

Sirf specific Telegram users ko bot use karne do. hermes config file mein allowlist add karo:

```
nano ~/.hermes/config.yml
```

Apna Telegram user ID @userinfobot se pata karo, phir config mein add karo.

Part 10 — Common Errors aur Fixes

10.1 Error Table

Error	Fix
Bot reply nahi kar raha	Token check karo. hermes gateway dobara run karo.
pip command nahi mila	Python install check karo. 'pip3' try karo.
Permission denied	'sudo' lagao ya root user use karo
Gateway not running	'hermes gateway restart' run karo
VPS pe bot band ho gaya	tmux ya systemd use karo (Part 8 dekho)
SSH connection refused	VPS IP correct hai? Port 22 open hai?
curl: command not found	'apt install curl -y' run karo
hermes: command not found	PATH mein add karo ya 'python3 -m hermes' try karo
Token invalid error	BotFather se naya token generate karo
Config file not found	'hermes setup gateway' dobara run karo

10.2 Detailed Troubleshooting

Agar hermes command nahi mili:

```
export PATH=$PATH:~/.local/bin
echo 'export PATH=$PATH:~/.local/bin' >> ~/.bashrc
source ~/.bashrc
```

Agar pip install fail ho:

```
pip3 install hermes-agent --break-system-packages
```

Ya virtual environment use karo:

```
python3 -m venv hermes_env
source hermes_env/bin/activate
pip install hermes-agent
```

Agar VPS pe memory issue ho:

```
free -h
```

```
# Swap add karo agar RAM kam ho
fallocate -l 2G /swapfile
chmod 600 /swapfile
mkswap /swapfile
swapon /swapfile
```

□ Final Summary — Best Stack

Tumhare liye recommended workflow:

Environment	Use Case
Windows (PowerShell)	Pehli baar setup aur quick testing
Windows WSL / Mac / Linux	Development, debugging, production-like testing
VPS Hostinger KVM2	24/7 Live Production Bot

Production Checklist

- VPS running hai aur SSH access confirm
- Python + pip + curl + tmux installed
- Hermes Agent installed aur setup kiya
- Telegram bot token paste kiya
- hermes gateway test run successful
- Systemd service enable aur start kiya
- 'systemctl status hermes' — active (running) show ho raha hai
- Telegram pe 'hello' bheja aur reply aya
- Logs check kiye — koi error nahi
- Firewall aur security basic setup kiya

Congratulations! Tumhara Hermes AI Telegram bot ab 24/7 live hai. Kisi bhi issue pe Part 10 dekho ya NousResearch GitHub pe issue report karo.

❏ Quick Reference — Sabse Zaruri Commands

Command	Description
pip install hermes-agent	Hermes install karo
hermes setup gateway	Gateway setup (token paste)
hermes gateway	Gateway start karo
hermes gateway restart	Gateway restart karo
systemctl start hermes	Systemd service start
systemctl status hermes	Service status check
tmux new -s hermes	New tmux session
tmux attach -t hermes	Existing session resume
tail -f ~/.hermes/logs/gateway.log	Live logs dekho
journalctl -u hermes -f	Systemd live logs
ssh root@YOUR_VPS_IP	VPS connect karo
apt update && apt upgrade -y	System update
